Quarterly Update

Global Fixed Income

Absolute Return Strategy

Q1 2019

Highlights

- The Absolute Return strategy returned 1.17% gross of fees during the quarter.[1]
- Interest rate positioning added value, primarily from a long position in US rates during March. Wider US inflation breakevens also contributed.
- Securitized holdings were strong outperformers throughout the quarter. Spreads tightened across our ABS, CMBS, and non-agency MBS holdings.
- FX positioning outperformed in January. We were long the Norwegian Krone vs the Swedish Krona and the Euro. We were also long GBP vs the Euro and USD.
- Long positions in HY helped performance in January and February. Much of that outperformance was offset by material widening of HY energy holdings in March.
- We benefitted from long IG corporate positioning and good selection in February with most of that benefit offset by early March spread widening and unsuccessful short positions in AUD and European credit.

Market Review

US interest rates stabilized and moved sideways in January and February, before resuming the decline that began in November, 2018. Rate stabilization was achieved by a dovish Fed pivot in early January. Future rate hikes were shelved, with Chairman Powell saying “It’s a great time for the Fed to be patient, watch, and wait.” This dovish Fed turn demonstrates unprecedented monetary policy softening for a late cycle environment. New thinking was required as the Fed grew increasingly concerned that inflation expectations may be in the process of anchoring below 2%. Trailing realized inflation has been more powerful than Fed guidance in setting inflation expectations and the Fed wants to avoid the perception that 2% is an inflation ceiling. In March, weaker global economic data, particularly in the manufacturing sector, caused yields to turn sharply lower. The German PMI manufacturing survey slumped in March -2.9pts to 45.0, its lowest level since 2012. The European manufacturing PMI has fallen for 8 consecutive months. Rates found a bottom in late March as central banks sounded increasingly dovish around the globe. The Fed revealed it would halt balance sheet paydowns earlier than the market expected. For its part, the ECB lowered its growth and inflation projections and pushed expectations for a possible return to positive interest rates well into the future.

The US 10YR rate declined 28 bps to 2.41%, all of which occurred in March. Global rates followed the same pattern. German 10YR yields fell 31 bps to -0.07%, going negative for the first time since 2016. UK 10YR yields fell 27 bps to 1.00%. Australian 10YR yields continued to outperform global bond markets, falling 53 bps to 1.78%. Australian 10YR yields set a new all-time low in March. Japanese yields followed the global pattern but were more muted, falling 8 bps to -0.08%. Within Europe, French OATs tightened 7 bps to German Bunds. Italian BTPs widened 5 bps to Bunds, demonstrating stability after extreme volatility in 2018. As monetary policy stances eased around the globe, yield curve movements varied depending on the potential capacity for future rate cuts. Yield curves flattened in Europe where short rates may be as low as they can go while the 2-10 curve was fairly stable in the US. As parts of the US curve inverted – 10YR yields fell 3 bps below Fed Fund rates in late March – the 2YR fell 20 bps below Fed Funds to maintain its relationship to the 10YR. US Inflation breakevens climbed 17 bps to 1.88%, boosted by easier Fed policy and higher energy prices. Brent oil climbed 33% to 71.3 while WTI climbed 41% to 64.

Risk assets performed well across markets with stocks and commodities joining bond spread sectors in outperforming rates. Easier monetary policy was more effective at supporting risk assets than it was in boosting inflation expectations, explaining the different behaviour of rates vs spread markets. Investment grade corporates retraced 70% of their 4th quarter widening, tightening 32 bps to +119. HY corporates tightened 135 bps to +391 for a 65% retracement. EM had a full retracement, tightening 51 bps to +292, although it is worth noting that EM widened much less than most sectors in Q4. AAA CMBS tightened 18 bps to +87, underperforming comparable corporates after outperforming them in Q4. Mortgages continued tightening in response to rate volatility falling to an all-time low in March.

[1] Past performance is not indicative of future performance. Performance figures do not reflect the deduction of investment advisory fees. A client’s return will be reduced by the investment fees. If a client placed $100,000 under management and a hypothetical gross return of 10% were achieved, the investment assets before fees would have grown to $259,374 in 10 years. However, if an advisory fee of 1% were charged, investment assets would have grown to $234,573, or an annual compounded rate of 8.9%.

Portfolio Performance

The Absolute Return strategy returned 1.17% gross of fees during the quarter. The one year return is 1.08% gross of fees.

Interest Rates and FX

Our macro positions outperformed, driven primarily by a long position in US rates during March and favorable FX positioning in January. Our long US rates position was based on expectations for easier forward looking US monetary policy and the high correlation in recent months between 10YR yields and future Fed fund expectations. Weakening global growth in March provided an additional reason to position for lower rates.

FX positioning outperformed in January. We were long the Norwegian Krone (NOK) vs the Swedish Krona (SEK) and the Euro. We were also long GBP vs the Euro and USD. NOK outperformed SEK and EUR as the Norges Bank raise its key policy rate 25bp to 1.0% and signaled a further rate rise later this year, in contrast to the majority of other G10 central banks. GBP outperformed USD and EUR as the UK parliament chose to extend the Article 50 deadline from 29 March to 31 October, reducing the probability of a 'hard/chaotic Brexit' and at the same time increasing the chance of a 2nd referendum later in the year on leaving the EU.

Additional positions that added value were a long position in US inflation breakevens and a long position in France vs Germany. Breakevens outperformed in January and February as easier monetary policy supported the inflation outlook and energy prices moved higher. We gave back some of our gains in March as breakevens fell in sympathy with sharply lower nominal yields during the growth scare but we remain bullish on US breakevens going forward. French yields widened disproportionately to other spreads in December as the Yellow-Vest protests became more violent. French President Macron offered concessions to the protesters that hurt the budget outlook, further widening spreads. Since January, conditions have been favorable for French/German spreads to trade more in line with other sovereigns and we took advantage of that.

Securitized Sectors

Our securitized holdings were strong outperformers throughout the quarter. Relative value was quite attractive after the broad market spread widening in Q4 2018. Non-agency securitized sectors were particularly attractive entering 2019 because spreads were not threatened by heavy supply pressure or fundamental concerns. We increased our market value, spread duration contribution, and the variety of spread sectors we were long. Spreads tightened across our ABS, CMBS, and non-agency MBS holdings.

Our biggest winners included fixed rate CMBS, data center ABS, structured settlement ABS, and re-performing loan (RPL) CMOs. CMBS followed corporates spreads tighter. Data center ABS tightened in general and provided security specific outperformance in this sub-sector that is new enough to be inefficiently priced by issuer. We had sold our structured settlement ABS before the Q4 widening and were able to replace those positions in Q1 at attractive levels. Re-performing loan CMO deals performed particularly well in Q1 as they are one of the few non-agency securitized sectors that have seen significant supply growth. RPL issuers that needed to sell in the 4th quarter forced spreads wider, setting up attractive opportunities to add before supply and broad market spread pressure retreated in Q1. Spread widening in Q4 created opportunities to buy floaters at discount dollar prices in the Single Family Rental (SFR), CMBS, and RPL sectors. We were neutral agency MBS.

We used portfolio space created by corporate sales to add short duration fixed rate auto and equipment ABS deals as well as Canadian credit card floaters. These sectors cheapened late in 2018 as investors sold to create balance sheet for year end. Positions in these low risk sectors comfortably outperformed short treasuries with minimal reduction in liquidity.

Corporate Markets

We modestly added value in credit during the quarter. Overall credit markets did extremely well with IG corporates retracing 70% of their 4th quarter widening, tightening 32 bps to +119. HY corporates tightened 135 bps to +391 for a 65% retracement. Our long positions in HY helped performance in January and February. Likewise, we benefitted from long IG corporate positioning and good selection in February. We moved neutral our overall exposure to US IG and HY in early March as we grew concerned about how sharp the rally had been, the extent of positive trade news that appeared to be priced into the market, and weak global manufacturing data. Ultimately these moves to neutral proved premature as dovish central bank rhetoric sustained credit market performance.

We had some positions that detracted from performance as we did not fully anticipate the global spread rally that occurred. We implemented short credit positions with European and Australian Itraxx that underperformed when spreads continued to tighten. Much of our Jan/Feb HY outperformance was offset by material widening of our HY energy holdings in March.

Outlook

The key market driver heading into the second quarter is the continued shift in central banks towards a more dovish (or at least less hawkish) stance. This is a global phenomenon. The Fed and the ECB get the most attention as they retreat from policy tightening. The RBA and RBNZ may initiate new policy easing measures as rate cuts become more likely later in 2019. Easier policy seems likely to continue supporting risk markets. We are more skeptical of risk markets in Europe than places where central banks appear to have some ammunition left. One thing to watch in Q2 is the differential reaction to easier policy between rate and spread markets. Spread markets behaved in a "risk on" fashion in March while rate markets behaved in a "risk off" fashion. At some point, it seems rates will need to head higher if spreads are going to continue to tighten. This is particularly true given the flatness of the US yield curve. US rate volatility hit a record low in March and has reached the point where it should be hard to fall further.

Economic numbers have shown some inconsistency with global manufacturing slowing in March while labor markets remain quite strong. Headline inflation will be supported throughout Q2 as energy price increases flow through the data. Core inflation numbers have been slightly softer than expected. Politics should stay in the news as Brexit drones on and the US awaits the Mueller report (which was subsequently released on April 18, 2019). Thus far, financial markets and economic developments have been immune to political headlines and there is no expectation for that to change in Q4.
